Webmachine 0.7.71
Comments and Review Notes

1. Opened up a new MLAB database called "machines" and pointed the platform.json uri to that db instance
2. I opened up another MLAB database called 'testclient'. I then proceeded use the webmachine platform to register a new network
3. NOTE: I did update server.js with a call to testSeedDb in an attempt to auto generate test data (I can back that out if needed when I pull your next set of updates)
4. As I began the client registration process
    a. Noted that collection 'client' in /machines was updated properly
    b. I typed in an erroneous cell phone number – it saved it. I typed over the phone number and it updated the document in the collection correctly
    c. As we mature the product – more visual cues such as 'Data saved' or "data updated" will be needed
    d. But the forms are nice looking ----
5. The web tab is very very cool !! Immediate presence! Love this stuff!
    a. I filled in the form and attempted to launch and got the message: "There was an error processing your request"
    b. Tried both templates – neither worked for me –
6. I submitted payment data using 4242 4242 4242 4242
    a. I did not submit mm/yy etc – and the spinner just kept on spinning –
    b. I came back in a 2nd time and added fake data 06/20 for date … 202 for cv … 28211 for zip --- still kept spinning --- guessing this is a stripe issue? They don't like us testing against their test site ?

But overall very attractive pages for the client reg process ….

7. I selected 'delete my client' (should this button read … 'delete my network'?)
    a. Got the confirmation notice at top of page
    b. There was no back button to return to home –
    c. I did head back to page for network registration – and notice the network card was still visible for the test (I like these little cards that you're creating here … nice visual way to do this)
    d. I clicked on the card – and it did properly display the delete notification page (the message reads 'This platform has been deleted'. The navbar at top read 'Manage Your Client' … we should get all these headers and messages to line up here as we mature the platform ….)

I clicked on the member registration page
    1. Mercy appeared as available public network (pretty cool !!)
    2. I selected that – and went to member registration page

3. VERY VERY slick simple registration – I was in and then brought right back out to the hoe page – nice workflow here!
4. There are two 'find network' buttons on the /dashboard route …. Not sure what you had in mind here but you might want to turn the top network button into a link to docs, tutorials, …we could even create some videos and take them there to get instruction the why, what and how
